Understanding Rational Expressions

Rational expressions are mathematical expressions that can be represented as the quotient of two polynomials. They are often written in the form:

$$R(x) = P(x) / Q(x)$$

Where $P(x)$ and $Q(x)$ are polynomials. Understanding rational expressions involves several key concepts:

Components of Rational Expressions

Rational expressions consist of various components that students must learn to manipulate effectively. The key components include:

- **Numerator:** The top part of the fraction, which contains a polynomial.
- **Denominator:** The bottom part of the fraction, which also contains a polynomial and cannot be zero.
- **Domain:** The set of all possible values of the variable that do not make the denominator zero.
- **Simplification:** The process of reducing the expression to its simplest form, often by factoring and canceling common terms.

Operations on Rational Expressions

Students must also understand how to perform various operations involving rational expressions, including:

- **Addition and Subtraction:** Requires a common denominator.
- **Multiplication:** Involves multiplying the numerators and denominators directly.
- **Division:** Involves multiplying by the reciprocal of the divisor.
