Key Concepts Covered in Practice 1.3

In Practice 1.3, several key algebraic concepts are typically addressed. These concepts are essential for mastering Algebra 2 and include:

- **Functions and Their Properties:** Understanding the definition of a function, domain, range, and types of functions such as linear, quadratic, and polynomial.
- **Polynomial Operations:** Learning how to add, subtract, multiply, and factor polynomials effectively.

- **Rational Expressions:** Simplifying, adding, and subtracting rational expressions and understanding their limitations.
- **Systems of Equations:** Solving systems of equations using various methods such as substitution and elimination.
- **Quadratic Equations:** Solving quadratic equations using factoring, completing the square, and the quadratic formula.

Each of these concepts plays a vital role in developing a student's algebraic skills, preparing them for more advanced mathematical studies and real-world applications.

Detailed Answers to Practice Problems

Providing detailed answers to the problems in Practice 1.3 serves as a valuable tool for students. Here, we will outline solutions to common types of problems found in this section:

Example Problem 1: Solving a Quadratic Equation

Consider the equation: $x^2 - 5x + 6 = 0$. To solve this, we can factor the quadratic:

$(x - 2)(x - 3) = 0$. Hence, the solutions are:

- $x = 2$
- $x = 3$

Example Problem 2: Simplifying a Rational Expression

Consider the rational expression: $(6x^2 - 12)/(3x)$. To simplify, factor the numerator:

$6x^2 - 12 = 6(x^2 - 2) = 6(x - \sqrt{2})(x + \sqrt{2})$. Thus, the expression simplifies to:

$2(x - \sqrt{2})(x + \sqrt{2})$

Example Problem 3: Solving a System of Equations

Given the system:

- $2x + 3y = 6$
- $x - y = 4$

Using substitution, we can express x in terms of y from the second equation:

$x = y + 4$. Substituting this in the first equation gives:

$2(y + 4) + 3y = 6$. Simplifying yields:

$2y + 8 + 3y = 6$, thus:

- $5y + 8 = 6$
- $5y = -2$
- $y = -2/5$

Substituting y back gives:

$x = -2/5 + 4 = 18/5$.
