Cell Structure and Function

Students must be familiar with the basic unit of life: the cell. This includes the identification of cell organelles and their functions. Key components include:

- Nucleus
- Cell membrane
- Mitochondria
- Ribosomes

Understanding how these structures contribute to overall cell function is essential for the exam.

Tissue Types

Another critical area is the study of the four basic tissue types found in the human body:

- Epithelial tissue
- Connective tissue
- Muscle tissue

- Nervous tissue

Students should be able to identify these tissues under a microscope and understand their functions and locations within the body.

Organ Systems

Lab exam 1 also requires a solid grasp of the various organ systems, including:

- Cardiovascular system
- Respiratory system
- Digestive system
- Nervous system

Students should be able to explain how these systems work together to maintain homeostasis in the body.

Preparation Strategies for Success
