- **Circulatory System:** Comprises the heart, blood vessels, and blood. It is responsible for transporting oxygen, nutrients, hormones, and waste products throughout the body.
- **Respiratory System:** Includes the lungs and airways. This system facilitates gas exchange, supplying oxygen to the blood and removing carbon dioxide.
- **Digestive System:** Encompasses organs such as the stomach, intestines, and liver. Its primary function is to break down food, absorb nutrients, and eliminate waste.
- **Nervous System:** Composed of the brain, spinal cord, and nerves. It coordinates body activities by transmitting signals between different body parts.
- **Musculoskeletal System:** Consists of bones, muscles, and joints. This system supports body structure, enables movement, and protects vital organs.
- **Endocrine System:** Made up of glands that release hormones into the bloodstream. It regulates various bodily functions, including metabolism, growth, and reproduction.
- **Immune System:** Protects the body against pathogens and disease. It includes cells and organs that work together to defend the body.
- **Urinary System:** Comprises the kidneys, bladder, and urethra. Its main role is to filter blood, remove waste, and regulate fluid balance.

- **Reproductive System:** Responsible for producing offspring. It includes organs such as the ovaries and testes and is crucial for sexual health and reproduction.
