Understanding Angles in Geometry

What are Angles?

Angles are formed by two rays that share a common endpoint, known as the vertex. In geometry, angles are measured in degrees, with a full rotation equating to 360 degrees. Angles can be classified based on their measurements:

- **Acute Angle:** Measures less than 90 degrees.
- **Right Angle:** Exactly 90 degrees.
- **Obtuse Angle:** Between 90 and 180 degrees.
- **Straight Angle:** Exactly 180 degrees.
- **Reflex Angle:** Between 180 and 360 degrees.

Understanding these classifications is essential for solving problems that involve angle relationships, such as complementary and supplementary angles, which are vital in challenges like the Giant Angle Challenge V2.

Properties of Angles

Angles possess several properties that are foundational in geometry. These properties include:

- **Complementary Angles:** Two angles that add up to 90 degrees.
- **Supplementary Angles:** Two angles that sum to 180 degrees.
- **Vertical Angles:** Angles opposite each other when two lines cross, which are congruent.
- **Adjacent Angles:** Angles that share a common side and vertex.

Familiarity with these properties helps students tackle various geometry problems effectively, including those presented in the Giant Angle Challenge.
